How can teachers design a curriculum/lesson for effective instruction delivery?

Questions

What are the processes involved in designing a curriculum/instructional plan?

What are the considerations in designing a curriculum/instructional plan?
How can teachers design a curriculum/lesson for effective instruction delivery?

Where does planning actually start?

- A Look at the curriculum guide and pick the competency
- B Find out what my learners can already do
- C Decide the activity
- D Think about how I'll test them at the end

ZOOM POLL! Pick the ONE you honestly do first.

Taba (1962)'s answer: you start with the learners

The most ignored step in real planning and the one DepEd gives you the most tools for.

- | | | |
|---|------------------------------|---------------------------------------|
| 1 | Diagnosis of learners' needs | Phil-IRI · CRLA · ELLNA · LIS |
| 2 | Formulation of objectives | Unpacked from MATATAG competencies |
| 3 | Selection of contents | Curriculum guides · contextualization |
| 4 | Organization of contents | Spiral progression · Budget of Work |
| 5 | Selection of experiences | IDEA · 5E/7E inquiry |
| 6 | Organization of activities | The DLL's standard parts |
| 7 | What to evaluate & how | DepEd Order 8, s. 2015 · TOS · SF9 |

The seven processes, explained

Taba (1962).

- 1** **Diagnosis of learners' needs**
Determine what learners already know and can do. Formal: pre-tests, diagnostic assessments, reading inventories. Informal: observation, oral questioning, past outputs. Includes language profile, background, circumstances.
- 2** **Formulation of learning objectives**
State what learners will be able to do. Observable, measurable, learner-performance (not teacher activity). Span cognitive, affective and psychomotor domains.
- 3** **Selection of learning contents**
Choose subject matter using six criteria: validity, significance, utility, learnability, interest, feasibility. Selection is an act of exclusion.
- 4** **Organization of learning contents**
Arrange so learning builds: simple→complex, concrete→abstract, known→unknown. Governed by scope, sequence, continuity/spiral progression, and integration.
- 5** **Selection of learning experiences**
Choose activities that let learners practise the verb in the objective. Tyler's criteria: opportunity to practise, satisfying, within reach, multiple experiences per objective.
- 6** **Organization of learning activities**
Sequence within the lesson: preparatory (activate prior knowledge) → developmental (main learning) → closure (consolidate). Includes grouping, pacing, transitions.
- 7** **Determination of what to evaluate and how**
Decide the evidence and the tool. Diagnostic (before), formative (during, ungraded), summative (after). Must align to the objective's verb.

Organization of learning activities

Selection of learning experiences

Determination of what to evaluate
and how

Formulation of learning objectives

Selection of learning contents

Organization of learning contents

Questions

What are the processes involved in designing a curriculum/ instructional plan?

What are the considerations in designing a curriculum/ instructional plan?

How can teachers design a curriculum/lesson for effective instruction delivery?

The Three Domains of Learning

+

+

Head, heart, or hand?

Four objectives. For each, decide which domain it lives in. First instinct.

- A** “List the parts of a microscope.”
- B** “Willingly participate in the group experiment.”
- C** “Focus the microscope to produce a clear image.”
- D** “Appreciate the value of careful observation.”

One learner, three domains

Bloom's committee (1956) mapped learning into three overlapping domains. A whole lesson touches all three.

COGNITIVE

the HEAD

Knowledge and intellectual skills:
Thinking, understanding, reasoning.

Bloom (1956); revised by Anderson & Krathwohl (2001)

AFFECTIVE

the HEART

Attitudes, values, emotions, and willingness:
What the learner comes to care about.

Krathwohl, Bloom & Masia (1964)

PSYCHOMOTOR

the HAND

Physical skills and coordination:
Doing, performing, making.

Simpson (1972); also Dave (1970), Harrow (1972)

They overlap constantly. Learning to focus a microscope (hand) needs knowledge (head) and patience (heart).

1. Cognitive (the head)

Anderson & Krathwohl (2001) turned Bloom's nouns into verbs — because thinking is something learners DO.

Three changes in 2001: (1) nouns became verbs; (2) Create moved above Evaluate; (3) a knowledge dimension was added (factual, conceptual, procedural, metacognitive)

critique ·
justify

explain ·
summarize

define · list

use · solve ·
demonstrate

design ·
compose

differentiate ·
examine

The six levels, defined

	DEFINITION	VERBS	SAMPLE OBJECTIVE	ASSESESSES VIA
Remember	Retrieving relevant knowledge from long-term memory.	<i>define, list, recall, identify, name, state</i>	List the five elements of a short story.	Objective test items
Understand	Constructing meaning — interpreting, exemplifying, classifying, summarizing, inferring, comparing.	<i>explain, summarize, paraphrase, classify</i>	Explain in your own words the theme of the story.	Short answer, oral explanation
Apply	Carrying out or using a procedure in a given situation.	<i>use, demonstrate, solve, implement, execute</i>	Use the correct verb tense in five original sentences.	Problem sets, procedural tasks
Analyze	Breaking material into parts and determining how they relate to one another and to a structure.	<i>differentiate, organize, attribute, examine</i>	Analyze how word choice affects the tone of the passage.	Essays, structured analysis
Evaluate	Making judgments based on criteria and standards — checking and critiquing.	<i>critique, justify, defend, appraise, judge</i>	Evaluate the argument's strength using given criteria.	Critique papers, defenses
Create	Putting elements together into a coherent or original whole; reorganizing into a new pattern.	<i>design, compose, construct, formulate, produce</i>	Compose an original persuasive essay on a community issue.	Performance tasks, products

Two cautions:

It is NOT a strict staircase (learners can create at simple levels)

Higher-order is not always better (foundational knowledge is necessary — the error is stopping there).

FAST TYPE BY OPPAKENN! 😊

justify

classify

compose

differentiate

compute

enumerate

CHAT

Type the level for each. Fast. Wrong answers are free! Hesitation isn't.

THE REAL ONE

Now answer honestly:

Does the test you usually give actually reach that verb?

Philippine drift: instruction settles at Remember and Understand under large classes, short periods, and the ease of scoring objective tests. Nobody decides this. It accumulates, one reasonable compromise at a time.

2. Affective (the heart)

Krathwohl et al. (1964): five levels from merely noticing to living by a value.

1

Receiving

Willing to notice and attend.

verbs: listen, ask, be aware of

2

Responding

Willing to participate and react.

verbs: participate, comply, volunteer, enjoy

3

Valuing

Attaches worth; shows commitment.

verbs: value, justify, support, share

4

Organization

Fits the value among other values.

verbs: compare, prioritize, integrate, relate

5

Characterization

Acts consistently by the value; it defines them.

verbs: act, display, influence, embody

This is the domain that decides whether learning survives the exam. A student who values reading keeps reading.

3. Psychomotor/Behavioral (the hand)

Simpson (1972): seven levels from first sensing to inventing a new move.

- | | | |
|---|------------------------|--|
| 1 | Perception | Uses senses to guide action. |
| 2 | Set | Ready (mentally, physically, emotionally). |
| 3 | Guided Response | Imitates; learns by trial and error. |
| 4 | Mechanism | Performs with habitual confidence. |
| 5 | Complex Overt Response | Skilled, accurate, smooth. |
| 6 | Adaptation | Modifies the skill to fit new situations. |
| 7 | Origination | Creates a new movement or technique. |

Not just PE and TLE. Handwriting, oral reading fluency, lab technique, and a clear demonstration all live here.

Simple Exercise!

Topic: Proper handwashing (Grade 1)

Cognitive objective (head): “The learners will identify the seven steps of proper handwashing.”

As written, a child could ace this lesson and still not wash their hands. That's the problem with a head-only plan.

HEART (affective)

Write an objective about willingness or valuing.
What should they come to CARE about?

HAND (psychomotor)

Write an objective about the physical skill. What
should they be able to DO with their hands?

A complete lesson teaches the child to know it, care about it, and do it.

Why this matters for a Filipino teacher

The three domains are already written into the tools DepEd uses

● The DLL objective line

DepEd lesson plans ask objectives to cover knowledge, skills, and attitudes — that is cognitive, psychomotor, and affective by another name.

● DepEd core values

Maka-Diyos, Makatao, Makakalikasan, Makabansa are affective-domain targets. Values integration in every lesson is affective-domain planning.

● KPUP and DO 8, s. 2015

Knowledge and Process lean cognitive; Performance is where psychomotor and higher affective outcomes are assessed, through performance tasks and rubrics.

● PPST Domain 1 & 4

Planning objectives across the three domains is part of Content Knowledge and Pedagogy (1) and Curriculum and Planning (4).

● Balanced assessment

A quiz reaches the head. A rubric-scored demonstration reaches the hand. Observation and self-report reach the heart. Each domain needs its own tool.

Provide assessment tools for each domain!

Each domain needs its own kind of assessment. Type the tool for each.

Cognitive (head)

Written test, quiz, oral questioning, essay

Psychomotor (hand)

Performance task + rubric, skills checklist, demonstration

Affective (heart)

Observation over time, self-report, rating/Likert scale, journal

Which domain is HARDEST to assess honestly, and why?

Eight things that keep a plan honest

● L__r__s

Who is actually in the room?

● __j__i__s

What must they be able to do?

● C__t__t

Is it worth their limited time?

● __r__e__es

Do they perform the verb?

● R____r__s

Does this exist in my school?

● A__e_s__t

Planned first, not last.

● __m__

Does it fit the real period?

● P____c__

Standards · PPST · DO 8 s.2015

A plan that ignores who the learners are is a plan for an imaginary class, and imaginary classes are always easier to teach.

The eight considerations in designing a curriculum/plan

● Learner characteristics	Developmental stage, prior knowledge, language background, readiness, interest, learning profile. Includes learners with disabilities, gifted learners, IP learners, and those in difficult circumstances. Tomlinson: differentiate content, process, product or environment.
● Learning objectives / competencies	The anchor. Every other element traces back. Vague objectives mean the plan drifts unnoticed until assessment reveals it. Share them with learners — they can't aim at a hidden target.
● Content or subject matter	Accurate, essential, developmentally appropriate, connected to the learners' world. Every topic included is a topic chosen over something else.
● Teaching and learning strategies	Must match the objective AND the learners. Higher-order objectives need higher-order engagement. The question isn't 'what would be fun?' but 'what would require them to do the thing?'
● Learning resources and environment	What actually exists: textbooks, materials, technology, space, class size. Plus emotional safety, learners who don't feel safe won't risk the errors learning requires.
● Assessment and evaluation	Planned from the start, not appended. Backward design: identify results, determine evidence, then plan instruction.
● Time and pacing	Fixed period, quarter, year including interruptions. Overloading is rarely ambition; more often it's a failure to decide what matters most.
● Curriculum standards and policies	K to 12 / MATATAG standards, DO 8 s.2015, PPST (DO 42 s.2017), Child Protection Policy, inclusive education mandate. Standards define the destination, not every step of the route.

Plan Doctor: Annotate the damage 😞

Grade 7 English (50 minutes)

Objective:	Learners will analyze how word choice creates tone.
Content:	12 figures of speech + 3 poems + tone vocabulary.
Activity:	Teacher lectures on all 12; learners copy notes.
Materials:	PowerPoint, projector, class set of tablets.
Assessment:	20-item identification quiz on the 12 figures.
Timing:	Lecture 40 min, quiz 15 min, group work 10 min.

Find at least 4 ERRORS!

- Circle what's broken.
- Name the consideration it breaks when called
- One person, one circle
- Bonus: If you plan like this, what can be your action plan for yourself?

Be honest: what's your real order?

When you plan a lesson, what do you write down FIRST, SECOND, THIRD?

The activity

What we'll do in class

The test

How I'll grade it

The outcome

What they must be able to do

CHATBOX

Type your real order (e.g., PNU or NUP or UPN or UPN, etc.)

Constructive alignment

Biggs & Tang: outcome, activity, and assessment must all point at the same verb.

“Learners are shrewd. When activities and assessment disagree with the stated outcome, learners follow the assessment.”

What misalignment looks like

Outcome says “design.”

Activities say “listen and take notes.”

Assessment says “identify from a list.”

Three different subjects are now being taught in the same room and the learners will pick the third one.

Spot the break!

Three chains. Which are broken and at which link exactly?

CHAT POLL!

You're already doing Gagné'!

Nine events matched to the internal conditions learning requires... you're naming what you already do.

GAGNÉ'S EVENT		WHAT IT DOES	YOURPLAN
1	Gain attention	Present a stimulus that readies learners: a question, a problem, a surprise.	Motivation
2	Inform objectives	State what they'll be able to do and the standard expected.	Establishing a purpose
3	Stimulate recall	Connect to prior knowledge — new knowledge attaches to old or not at all.	Reviewing previous lesson
4	Present content	Organize and chunk meaningfully, using multiple modes.	Presenting examples
5	Provide guidance	Scaffold: model, give examples and non-examples, then withdraw support.	Discussing new concepts
6	Elicit performance	Have them DO it, so understanding is confirmed rather than assumed.	Developing mastery
7	Provide feedback	Descriptive, not just confirmatory. Only descriptive moves performance.	Guided practice + feedback
8	Assess performance	Test whether the objectives were achieved, using varied methods.	Evaluating learning
9	Enhance transfer	Connect to real applications; re-represent ideas so knowledge generalizes.	Practical applications

POLL

Which event do you skip most when the period runs short?

Questions

What are the processes involved in designing a curriculum/ instructional plan?

What are the considerations in designing a curriculum/ instructional plan?

How can teachers design a curriculum/lesson for effective instruction delivery?

Seven teaching styles!

No style is superior. The skill is matching style to objective, content and learners and having the range to match.

STYLE	WHAT IT IS	BEST FOR	THE RISK
● Lecture / Direct Instruction	Teacher explicitly presents in a structured, teacher-directed sequence.	Introducing new content efficiently; misconception-prone concepts.	Passivity if used alone.
● Demonstration	Teacher performs the skill while learners observe, then practise.	Procedural knowledge; anything that must be seen.	Learners watch but never perform.
● Facilitative / Student-Centred	Teacher guides rather than tells; learners construct understanding.	Independence, reasoning, deep understanding.	Needs skilled questioning; can confirm errors.
● Inquiry-Based	Starts from a question or phenomenon; learners investigate.	Scientific thinking, curiosity, evidence-based reasoning.	Unguided inquiry produces confident error.
● Cooperative Learning	Structured groups with positive interdependence + individual accountability.	Social competence, peer learning, large classes.	Without accountability, one learner does everything.
● Project-Based Learning	Extended project with an authentic product and real audience.	Integrating competencies; connecting school to life.	Impressive product can hide thin learning.
● Differentiated Instruction	Proactively varies content, process, product or environment.	Wide ranges of readiness (i.e. most classrooms).	Hardest to sustain at scale. Tomlinson: proactive design, not reactive rescue.

Project-Based Learning

Demonstration

Facilitative / Student-Centred

Lecture / Direct Instruction

Inquiry-Based

Cooperative Learning
Differentiated Instruction

Whose problem is this?

Three learners. For each, click who needs to change. First instinct, not the polite answer.

Maria won't read aloud. She freezes every time.

Jun explains it perfectly out loud. He fails the written test.

Ana misses the English lecture entirely.

Poll options for each learner:

(A) The learner needs to try harder or get support

(B) The lesson needs to change

UDL: the barrier is in the design *Not in the learner...*

ENGAGEMENT

the WHY

Guidelines: Welcoming interests & identities, sustaining effort & persistence, emotional capacity

Maria: offer a choice such as read aloud, read to one partner, or record it at home.

REPRESENTATION

the WHAT

Guidelines: Perception, language & symbols, building knowledge

Ana: draw while you explain, gesture, allow peer translation to the Mother Tongue.

ACTION & EXPRESSION

the HOW

Guidelines: Interaction, expression & communication, strategy development

Jun: let him show it orally or by diagram. If the outcome isn't 'write,' writing is a barrier.

 [UDL at a Glance \(CAST\)](#)

[https://www.youtube.com/watch?v=nULtw1Vwo-](https://www.youtube.com/watch?v=nULtw1Vwo-A)

[A](#)

The most widely taught idea in teacher education that the evidence doesn't support.

What VARK gets right

- Learners really do differ.
- Content itself has modal demands.
- Multimodal teaching helps nearly everyone.
- Many learners are multimodal anyway.

What the evidence doesn't support

- That matching instruction to a preferred style raises achievement (the “meshing hypothesis”).
- That each learner has one fixed channel.
- Fleming & Baume (2006) call VARK a reflection tool, not a diagnosis.

The four modes: **Visual** (diagrams & symbols, not pictures generally), **Aural** (heard or discussed), **Read/Write** (words, lists, notes), **Kinesthetic** (experience & practice)

“He's a kinesthetic learner, so he struggles with reading.”

This sentence explains nothing and excuses a great deal. In Philippine classrooms the real reason to teach multimodally isn't preference, it's language. A learner who misses the English explanation may still get the diagram.

Name That Learner!

V Visual

A Auditory

R Reading/Writing

K Kinesthetic

8

Watching a diagram-filled explainer video

6

Reading the textbook chapter aloud to a partner

2

Listening to a podcast on the topic

5

Color-coding a mind map

4

Rewriting your notes into a summary

3

Role-playing a market transaction

7

Building a model with your hands

1

Making a bullet-point list of key terms

Let's Check an Actual ILAW!

KPUP: four levels of learning outcomes *(DepEd, 2012)*

K

Knowledge

Facts, concepts, terms and information: the foundation for all higher learning.

e.g. Identify the eight parts of speech.

Written Work

P

Process

The skills used in working with knowledge: what they can DO with what they know.

e.g. Organize ideas using a graphic organizer.

Written Work

U

Understanding

Enduring big ideas learners internalize and can TRANSFER to unfamiliar situations.

e.g. Justify an interpretation using textual evidence.

Performance Task

P

Performance

Authentic application: real or realistic tasks, judged against criteria known in advance.

e.g. Deliver a persuasive speech on a community issue.

Performance Task

*Understanding is tested by TRANSFER, not repetition.
If the case is one they've already seen, you're still measuring Knowledge.*

Assessment tools for each level

LEVEL	TOOLS	STRENGTH	THE CATCH
Knowledge	Multiple choice · true/false · matching · identification · completion	Efficient, objective, scalable across large classes; broad sampling fast.	Cannot reveal whether learners can USE what they recall.
Process	Short answer · problem sets · graphic organizers · concept maps · procedural checklists	Makes the learner's process visible, not just the answer, also allows targeted remediation.	Slower to mark than objective items.
Understanding	Essays (restricted & extended) · open-ended items · reflection papers · oral defense · transfer tasks	Distinguishes learners who grasp the idea from those who memorized your phrasing.	Needs a rubric or scoring is impressionistic.
Performance	Speeches · demonstrations · role plays · experiments · portfolios · videos · campaigns	Assesses integrated competence under realistic conditions.	Criteria must be explicit and shared BEFORE, or it's a guessing game about your taste.

Five principles governing tool selection

Alignment, Validity, Reliability, Fairness, Practicality

True or False (*DepEd, 2026*)

- A** KPUP (Knowledge, Process, Understanding, Performance) is still the basis for grading.
- B** Kindergarten to Grade 3 will move to a descriptive, non-numeric report.
- C** Performance Tasks now carry the biggest weight in most subjects.
- D** The old transmutation table is being phased out toward zero-based grading.

KPUP is gone. Here's what replaced it!

The old four-level KPUP is out. Grading now runs on three summative components.

OLD! (DO 8, s. 2015)

KPUP levels of learning:

- ✕ Knowledge
- ✕ Process
- ✕ Understanding
- ✕ Performance

Components were Written Work, Performance Tasks, Quarterly Assessment across four quarters.

NEW! (DO 015, s. 2026)

Three summative components:

WWs

Written or Oral Works

PTs

Product or Performance Tasks

EXs

Examinations
(Summative Tests + Term Exam)

Also new: three-term calendar, four Key Stages graded differently, and a move toward zero-based grading.

Assessment: The three components, defined (DepEd, 2026)

What each component actually measures

WWs

Written or Oral Works

Summative tasks needing written or spoken responses: essays, journals, written reports, structured presentations.

PTs

Product or Performance Tasks

Application of knowledge and skills in authentic contexts: projects, portfolios, investigations, performances.

EXs

Examinations

Two Summative Tests (ST1, ST2) during the term plus one Term Examination (TE) at the end.

Notice the shift: two of the three components reward doing and applying, not just recalling.

Four Key Stages, graded differently

The biggest change: how you grade now depends on the learner's Key Stage.

KS1

Kinder – Grade 3

DESCRIPTIVE, non-numeric. Letter descriptors + narrative feedback.
No numerical grade, no honor ranking.

KS2

Grades 4 – 6

NUMERICAL. Three components with prescribed weights. Adjusted transmutation this year.

KS3

Grades 7 – 10

NUMERICAL. Same three components; GMRC/Values also graded on three domains.

KS4

Grades 11 – 12

NUMERICAL. Senior High weights vary by track and subject group.

The component weights (Grades 4-10)

Prescribed by the order.

Learning Area	WWs	PTs	EXs
English, Filipino, Math, Science, AP, GMRC / Values Ed.	20%	50%	30%
EPP / TLE and MAPEH	20%	60%	20%

The pattern to remember

Product/Performance Tasks carry the MOST weight (50-60%) in every subject. Examinations are the smallest slice. The policy is telling you where to put your assessment energy: authentic performance, not testing.

Inside the Examinations component

- Summative Test 1 = 30%
- Summative Test 2 = 30%
- Term Examination = 40%

Finally...

3

you'll keep

Ideas you'll use next week.

2

you'll change

Something in your planning that has to go.

1

you'll admit

A gap you're ready to name out loud.

Where resources are scarce, design is the resource that remains.

Take it further!
